

The Impact of Cognitive Reserve on CSF Biomarkers of AD

Sanjay Asthana, MD, FACP

Associate Dean for Gerontology

Director, Wisconsin Alzheimer's Disease Research Center (ADRC)

Director, Madison VA Geriatric Research, Education & Clinical Center

Professor & Head, Division of Geriatrics & Gerontology

Duncan G. & Lottie H. Ballantine Endowed Chair in Geriatrics

*University of Wisconsin School of Medicine and Public Health,
Madison, WI*

DISCLOSURES

Current and past sources of funding include grants from:

- National Institute on Aging
- Department of Veterans Affairs
- State of Wisconsin
- John A. Hartford Foundation
- Alzheimer's Association
- UW-Madison and UW School of Medicine and Public Health
- Pharmaceutical companies (Merck, Pfizer, Lundbeck, Toyoma Chemical, Eli Lilly, Wyeth, Parke Davis, Ciba-Geigy)

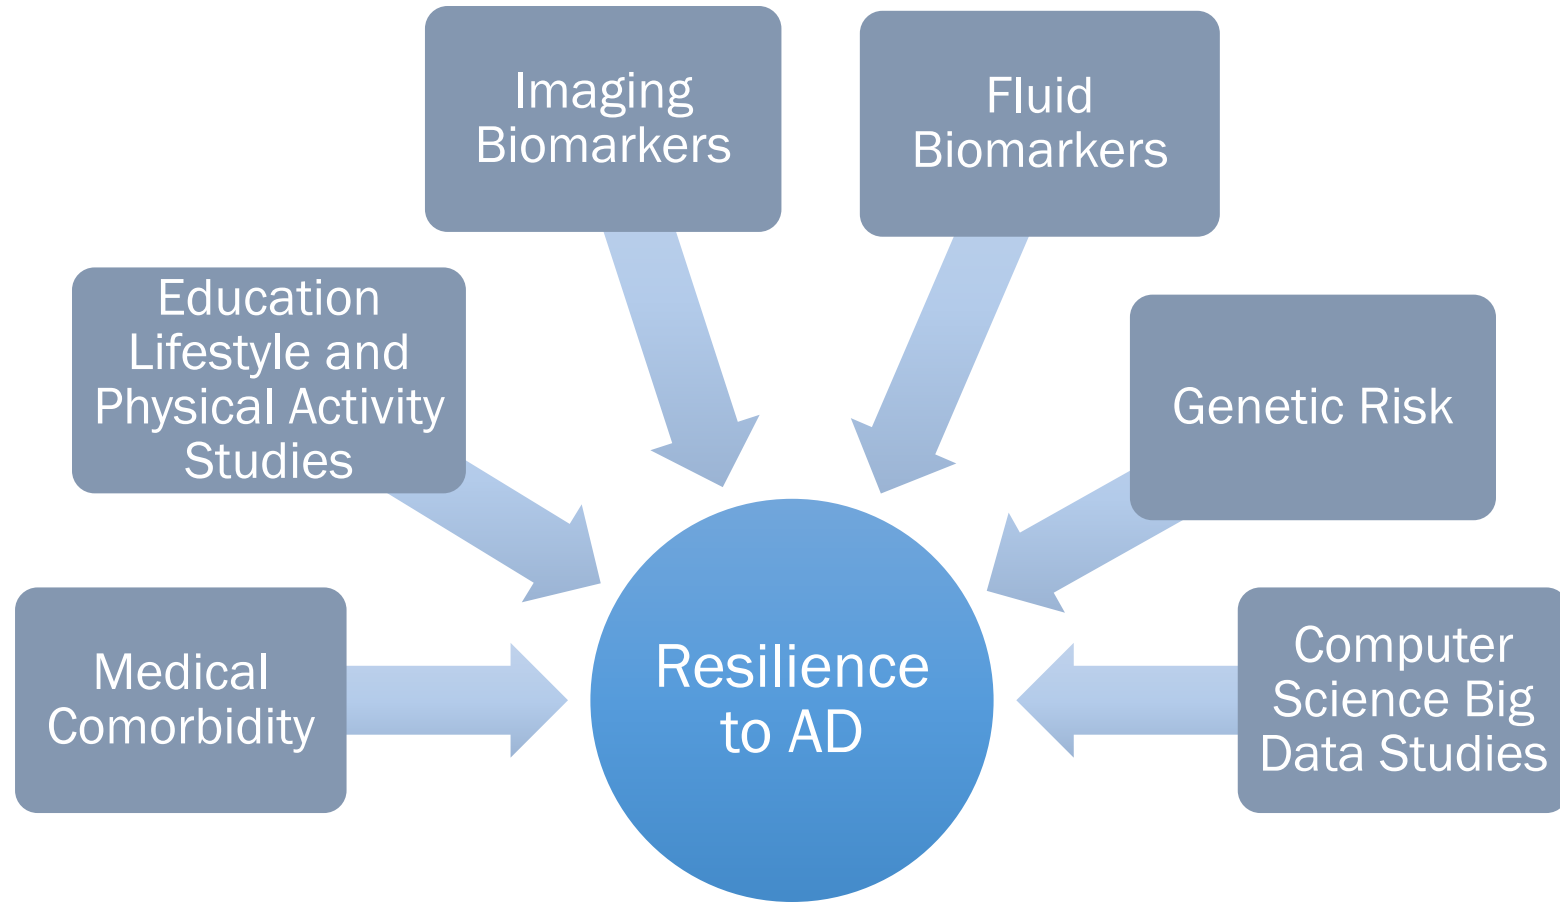

Cognitive Reserve: Resilience to AD

Biomarkers of Alzheimer's Disease

*Adapted from Jack et al.
Lancet Neurology (2013)*

Molecular Neurobiology of AD: CSF Biomarkers

CSF Biomarkers of Alzheimer's Disease

AD Pathology-Related Mechanism	CSF Measure
Amyloid Deposition	A β 40, A β 42, sAPP α , sAPP β , A β oligomers, BACE1 levels/activity, ratios e.g., A β 42/p-Tau, A β 40/A β 42, N-terminal truncated A β 42 APLP-1
Neurodegeneration	Total Tau, p-Tau, oligomeric forms of Tau
Neuronal/Axonal Damage and White Matter Integrity	Neurofilament L (NFL),
Synaptic Function/Damage	Neurogranin, SNAP25, Visinin-like-protein 1 (VLP1),
Neuroinflammation	YKL-40, MCP1, Soluble form of TREM2, cytokines, chemokines, com3, S-100

Potential CSF Biomarkers of Cognitive Reserve

Cognitive Reserve-Related Mechanisms	CSF Measure
Reduced amyloid deposition	A β 40, A β 42, sAPP α , sAPP β , A β oligomers, BACE1 levels/activity, ratios e.g., A β 42/p-Tau, A β 40/A β 42, N-terminal truncated A β 42 APLP-1
Decreased neuronal and axonal damage	Total Tau, p-Tau, oligomeric forms of Tau
Neurogenesis	BDNF, GDF 15, Osteopontin (OPN)
Synaptogenesis	Neurogranin, SNAP25, Visinin-like-protein 1 (VLP1), MMP3
Reduced neuroinflammation	YKL-40, MCP1, Soluble form of TREM2, cytokines, chemokines, com3, S-100

Potential Limitations and Sources of Inconsistency in CSF Biomarkers of AD and Cognitive Reserve

Pre-analytical

- Subject selection & clinical diagnosis
- CSF Collection
- Sample processing, storage and shipment

Analytical

- Assay technique
- Reagents used
- Analytical procedures
- Equipment

Meta-analysis of CSF Biomarkers of AD

- Olsson et al. analyzed CSF data from 231 studies involving over 15,600 patients with AD, and more than 13,000 healthy controls
- Four CSF biomarkers – total tau, p-tau, neurofilament light chain (NFL) and A β -42 emerged as the most robust measures differentiating AD from controls
- Moderate effect sizes were observed for VILIP-1, neuron-specific enolase (NSE), YKL-40 and heart fatty acid-binding protein (HF-ABP)
- AD and controls could not be differentiated on CSF levels of A β -38, A β -40, sAPP α or β , MCP-1, GFAP and CSF-plasma ratio of albumin

BIOCARD: CSF Biomarkers and Longitudinal Cognitive Change

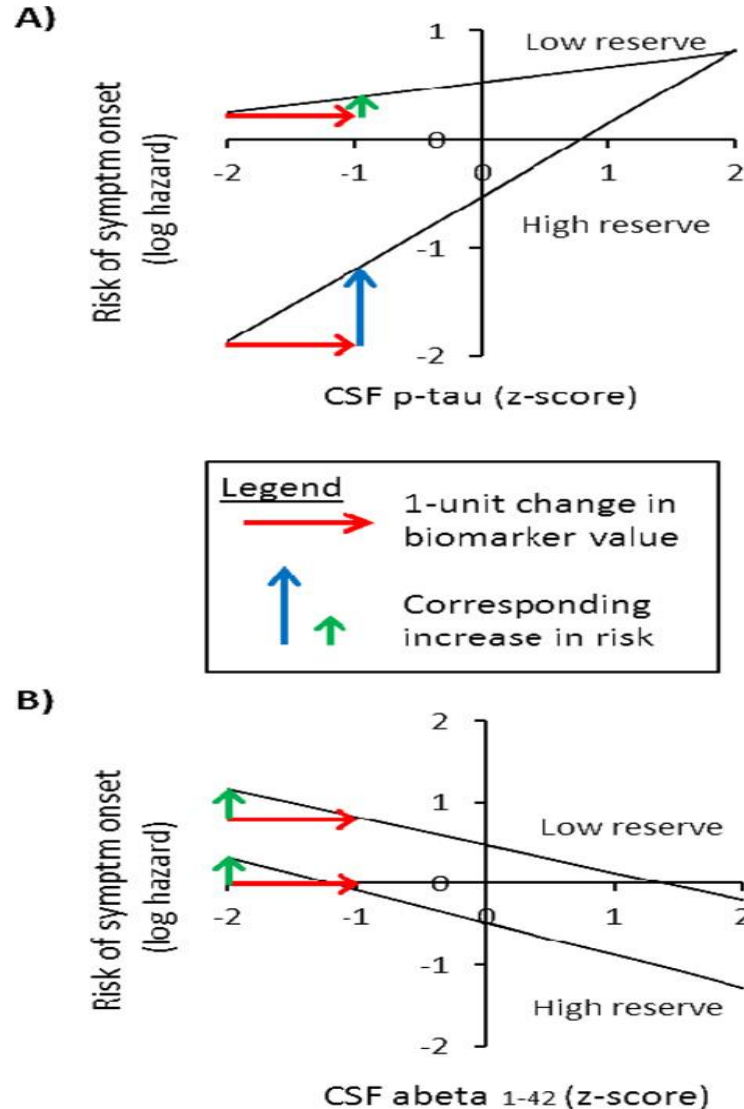

BIOCARD Study CSF results

CSF defined Stage 2 preclinical AD exhibits declines in cognition over a 10 year period. Soldan et al 2016 JAMA Neurol

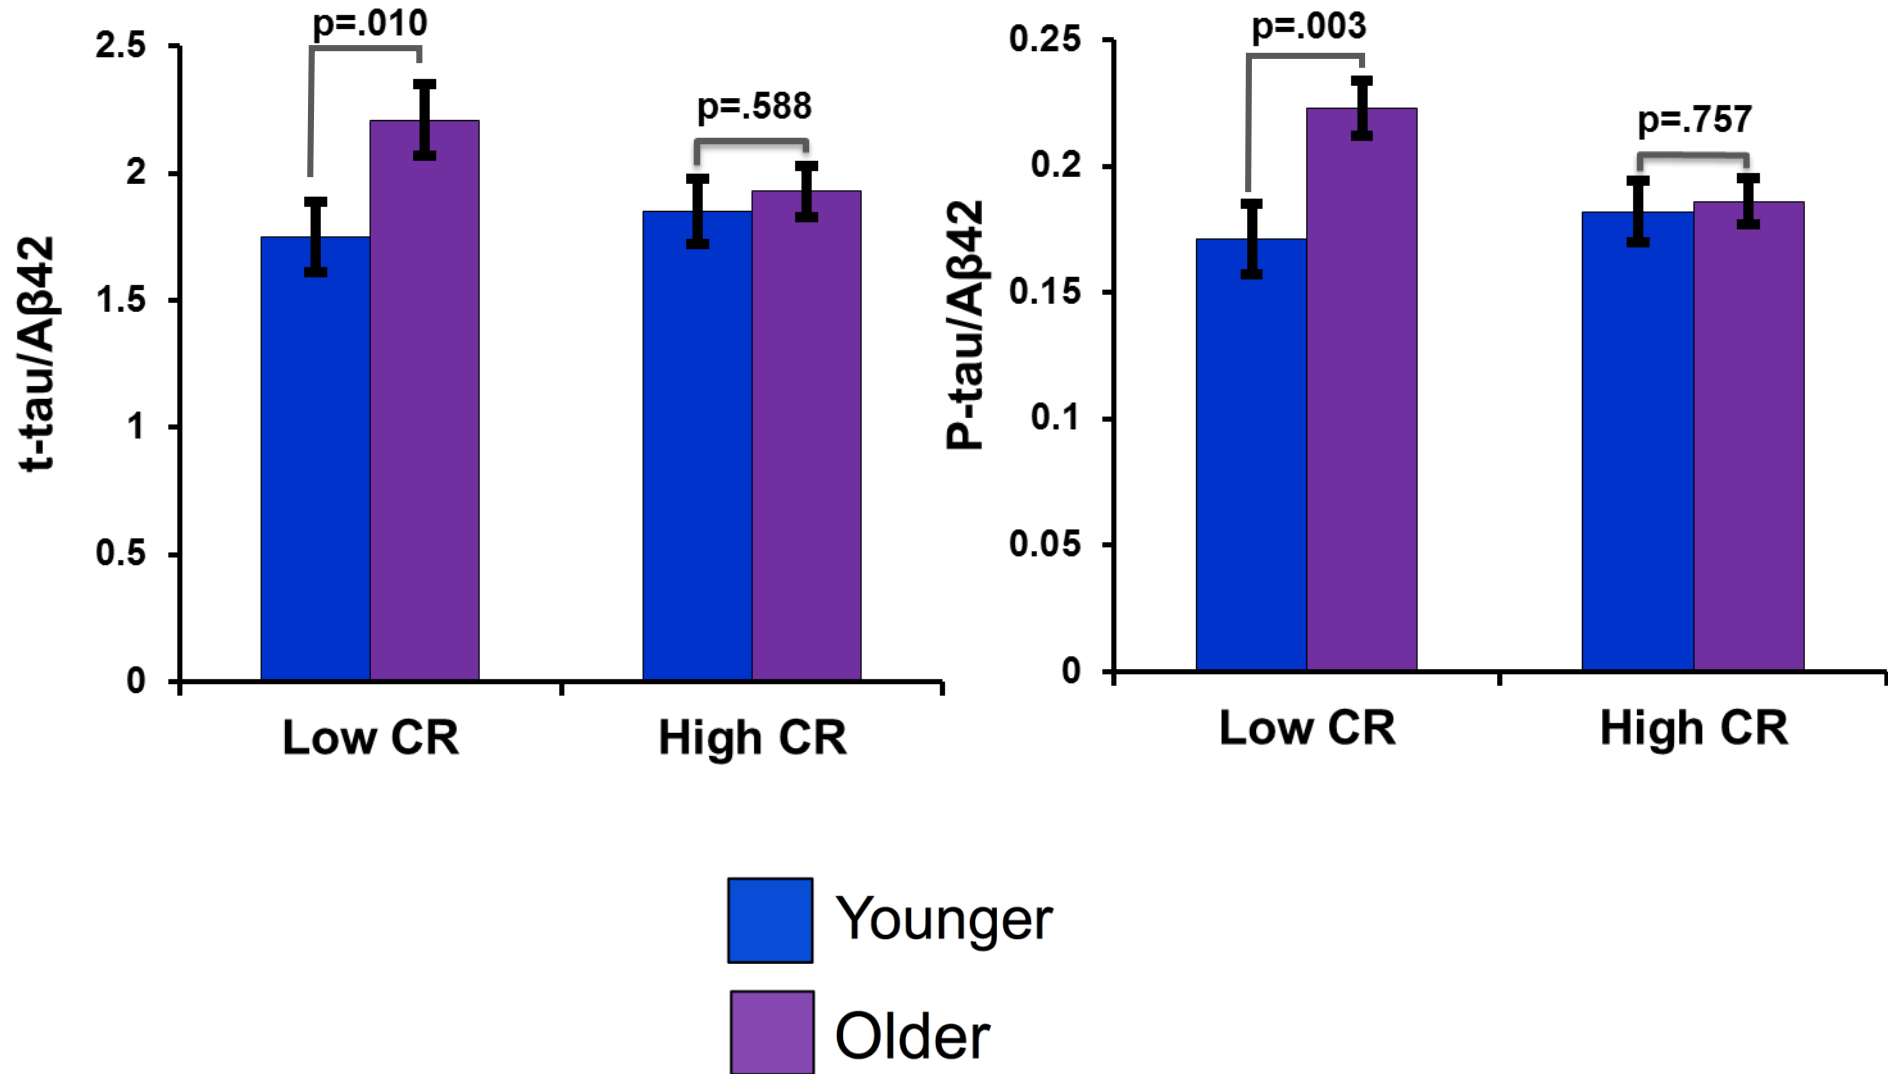

- 222 subjects (mean age-57yrs; range: 22-85) followed for 18 years. Baseline CSF used to create 4 hypothetical preclinical stages of AD
- Stage 2 individuals showed greater cognitive decline than those in Stage 0, 1 and SNAP; APOE4 did not affect the rate of cognitive decline

BIOCARD Study – Cognitive Reserve and CSF Biomarkers of Preclinical AD

- 239 participants (mean age - 57.2 yrs) from BIOCARD followed for 17 years
- Cognitive reserve (CR) measured by NART, vocabulary and years of education
- Increased risk of progressing from normal to symptom onset was found in those with lower CR, lower CSF A β levels and higher p-tau

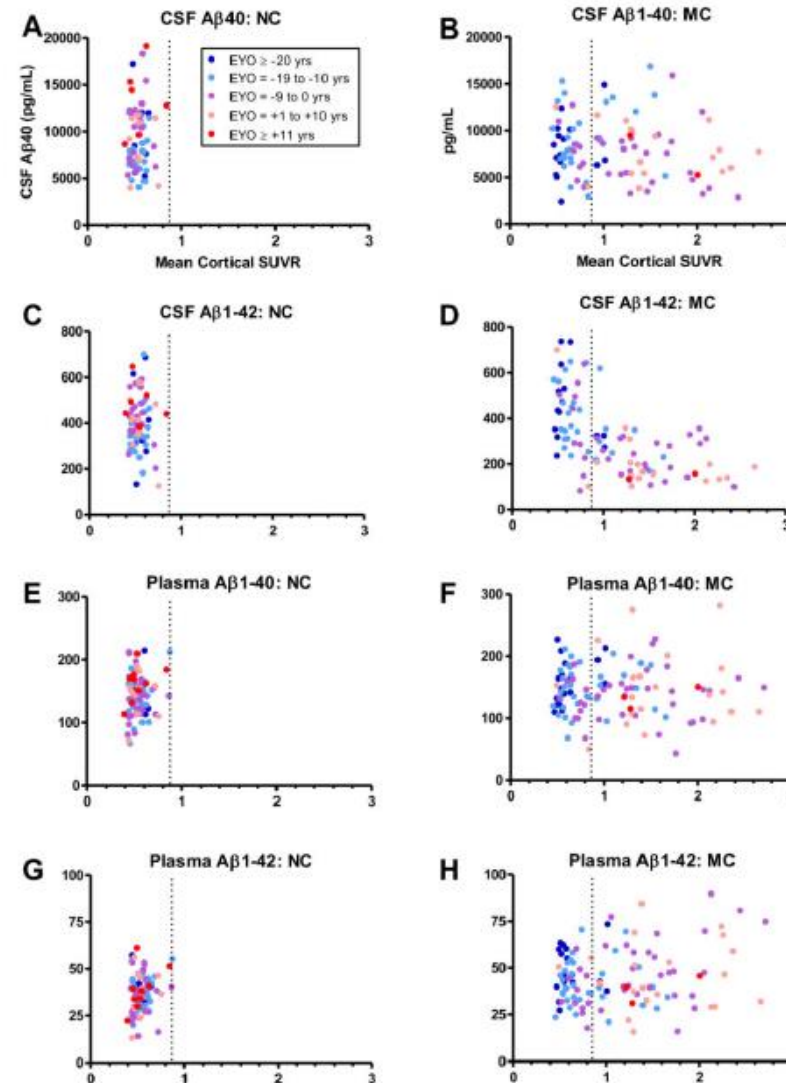

Wisconsin ADRC: Cognitive Reserve and CSF Biomarkers of AD

DIAN Study: CSF Biomarkers

Association between fluid A β measures and mean cortical PiB retention in NCs and MCs (A to H). Concentrations of CSF A β -40 (A & B) and A β -42 (C & D) and Concentrations of plasma A β -40 (E & F) and A β -42 (G & H) for NCs (left panels) and MCs (right panel)

6(226):226ra30.

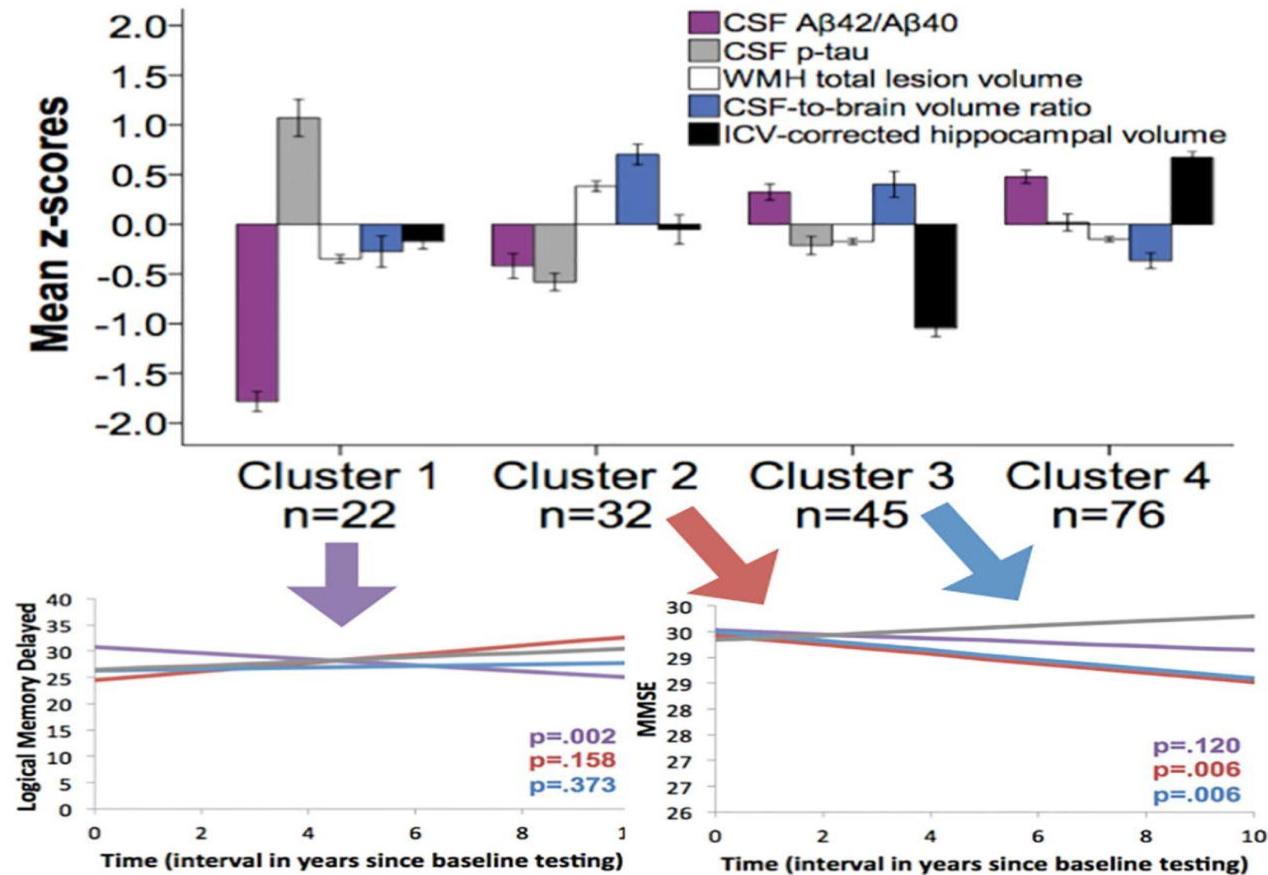

Wisconsin Cohorts on Preclinical AD

	University of Wisconsin Alzheimer's Disease Program	
	NIH Wisconsin ADRC	
Cohort	IMPACT	WRAP
Cohort characteristics	Ages 45-65 years at baseline AD parental history positive (PH+, 75%) and negative (PH-, 25%)	Ages 45-65 years at baseline AD parental history positive (PH+, 70%) and negative (PH-, 30%)
Sample size	n=450	n=1560
Year started	2009	2001
Visit frequency	Every other year	Every other year
Cognitive battery	NACC (National Alzheimer's Coordinating Centers) cognitive battery & additional tests	Extensive cognitive battery
Computerized cognitive battery	NIH Toolbox cognitive battery	Cogstate computerized battery
Questionnaires	Medical history, medications, lifestyle factors, sleep, cognitive activities, physical activity	Medical history, medications, lifestyle factors, sleep, cognitive activities, physical activity
Cerebrospinal fluid (CSF) samples	Baseline CSF samples in consented subjects; as of 2015, CSF collected every 2 years	Baseline and follow-up CSF samples in subset
Neuroimaging	Structural MRI, perfusion, 4-D flow, DTI	ADRC MRI, amyloid PET, tau PET

Wisconsin ADRC: Clinical Utility of CSF Biomarker Data – AD Risk Prediction

Wisconsin ADRC Data

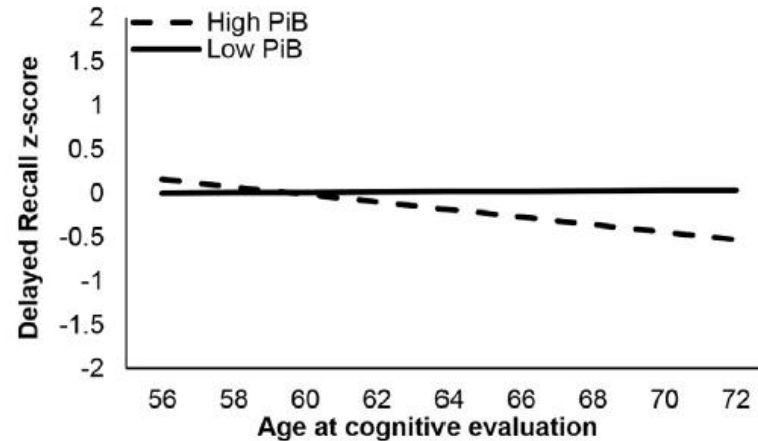

Annie M. Racine et al. Brain 2016;139:2261-2274

β -amyloid Burden in Cognitively Healthy Adults is Associated with Subtle Cognitive Decline

AIBL; Lim et al., 2014 BRAIN

WRAP; Clark et al., 2016 A&D

ADNI; Donohue et al., 2017 JAMA

Supported by recent meta-analyses

- Small to moderate differences observable on measures of global cognition, memory, language, visuospatial ability, processing speed, and executive functioning

Baker et al., 2017; Alzheimer's & Dementia (DADM)

Han et al., 2017; Neuropsychology Review

Wisconsin ADRC: $A\beta$ + only and $A\beta$ +/ τ + Groups - Greater Rates of Non-Linear Cognitive Decline with Age on List-Learning and Set-Shifting

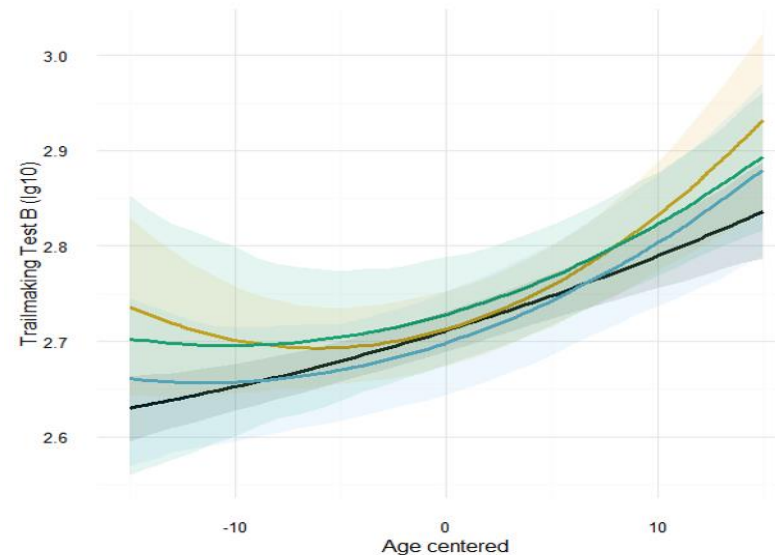

Fixed Effects:

- Biomarker Group
- Time (age at each visit – linear + quadratic)
- Gender
- Education
- Practice Effects
- Biomarker Group x Age at each visit (linear + quadratic)

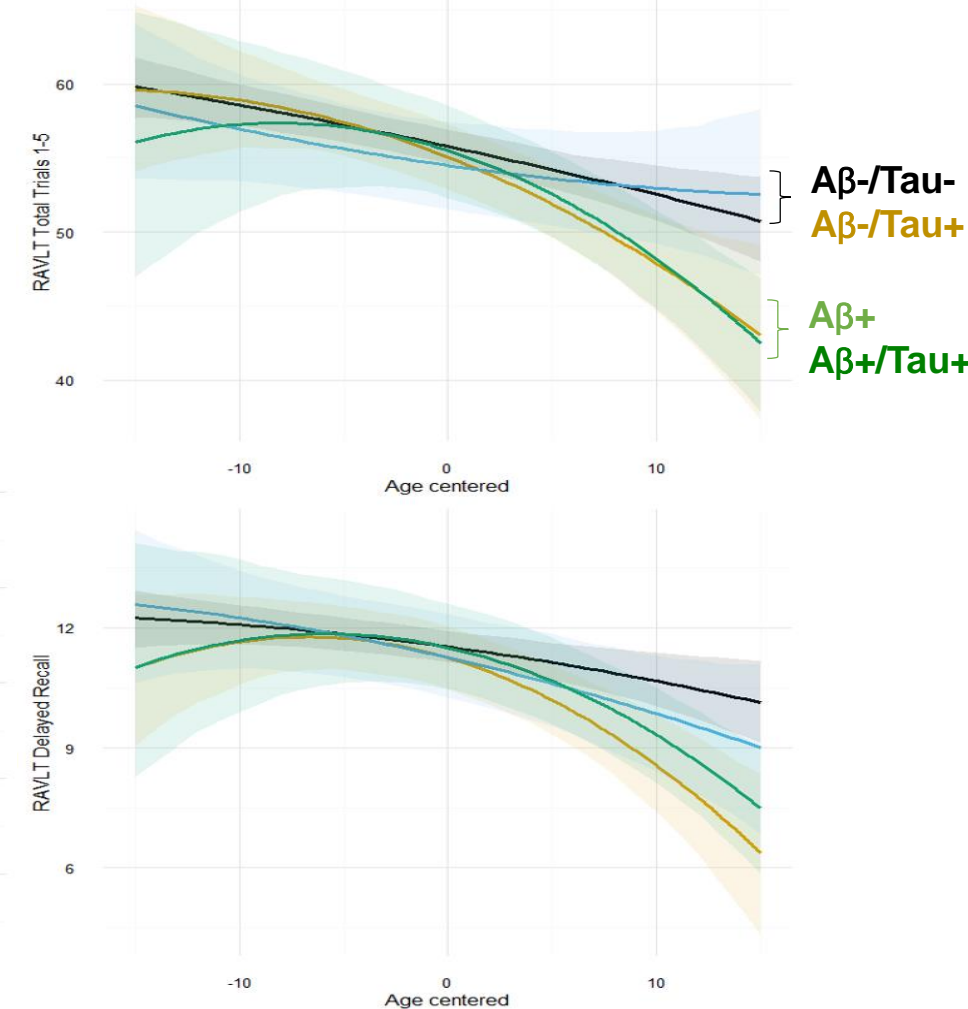

Random Effects:

- Intercept
- Slope

Executive Functioning (TMTB)

List-learning (RAVLT)

Time →

Mixed-effects regression models (R lme4)

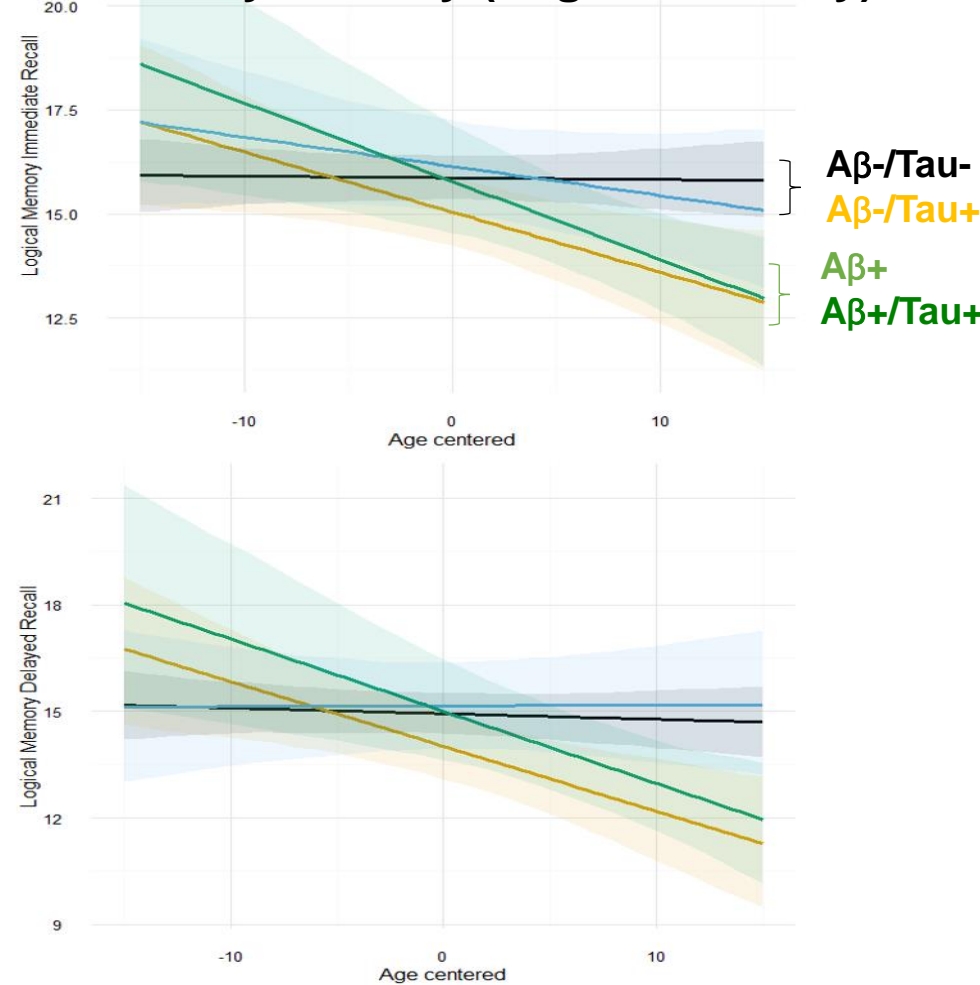

Wisconsin ADRC: CSF Biomarkers and Cognitive Function Trajectories in At Risk Study Participants

Executive Functioning (Digit Symbol)

Story Memory (Logical Memory)

Fixed Effects:
Biomarker Group
Slope (Age at each visit)
Gender
Education
Practice Effects
Biomarker Group x Age at each visit

Random Effects:
Intercept
Slope

Time →

Mixed-effects regression models (*R lme4*)

Wisconsin ADRC: CSF Positive Biomarker Groups & Modifiable Risk Factors

Modifiable factors that are differentially related to cognitive decline in biomarker positive subjects in late midlife

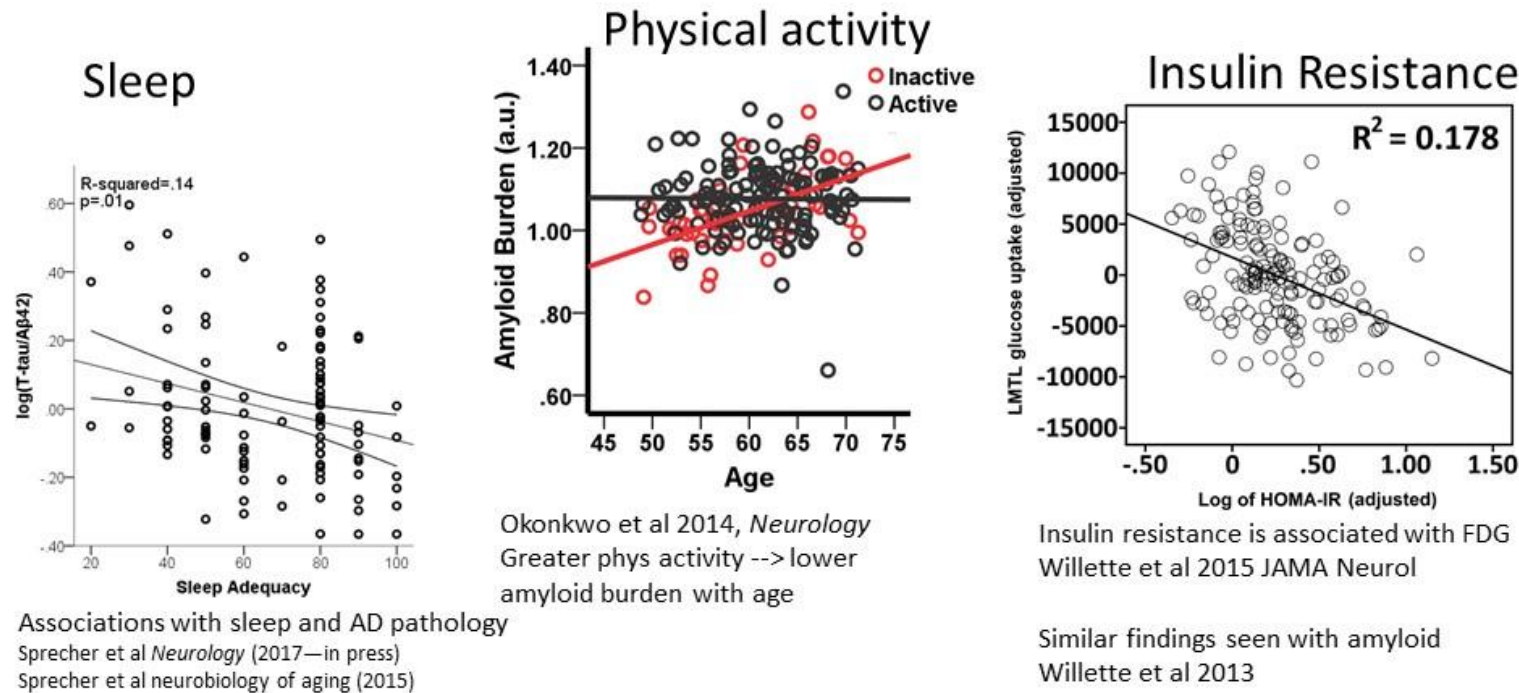

Clark et al in review

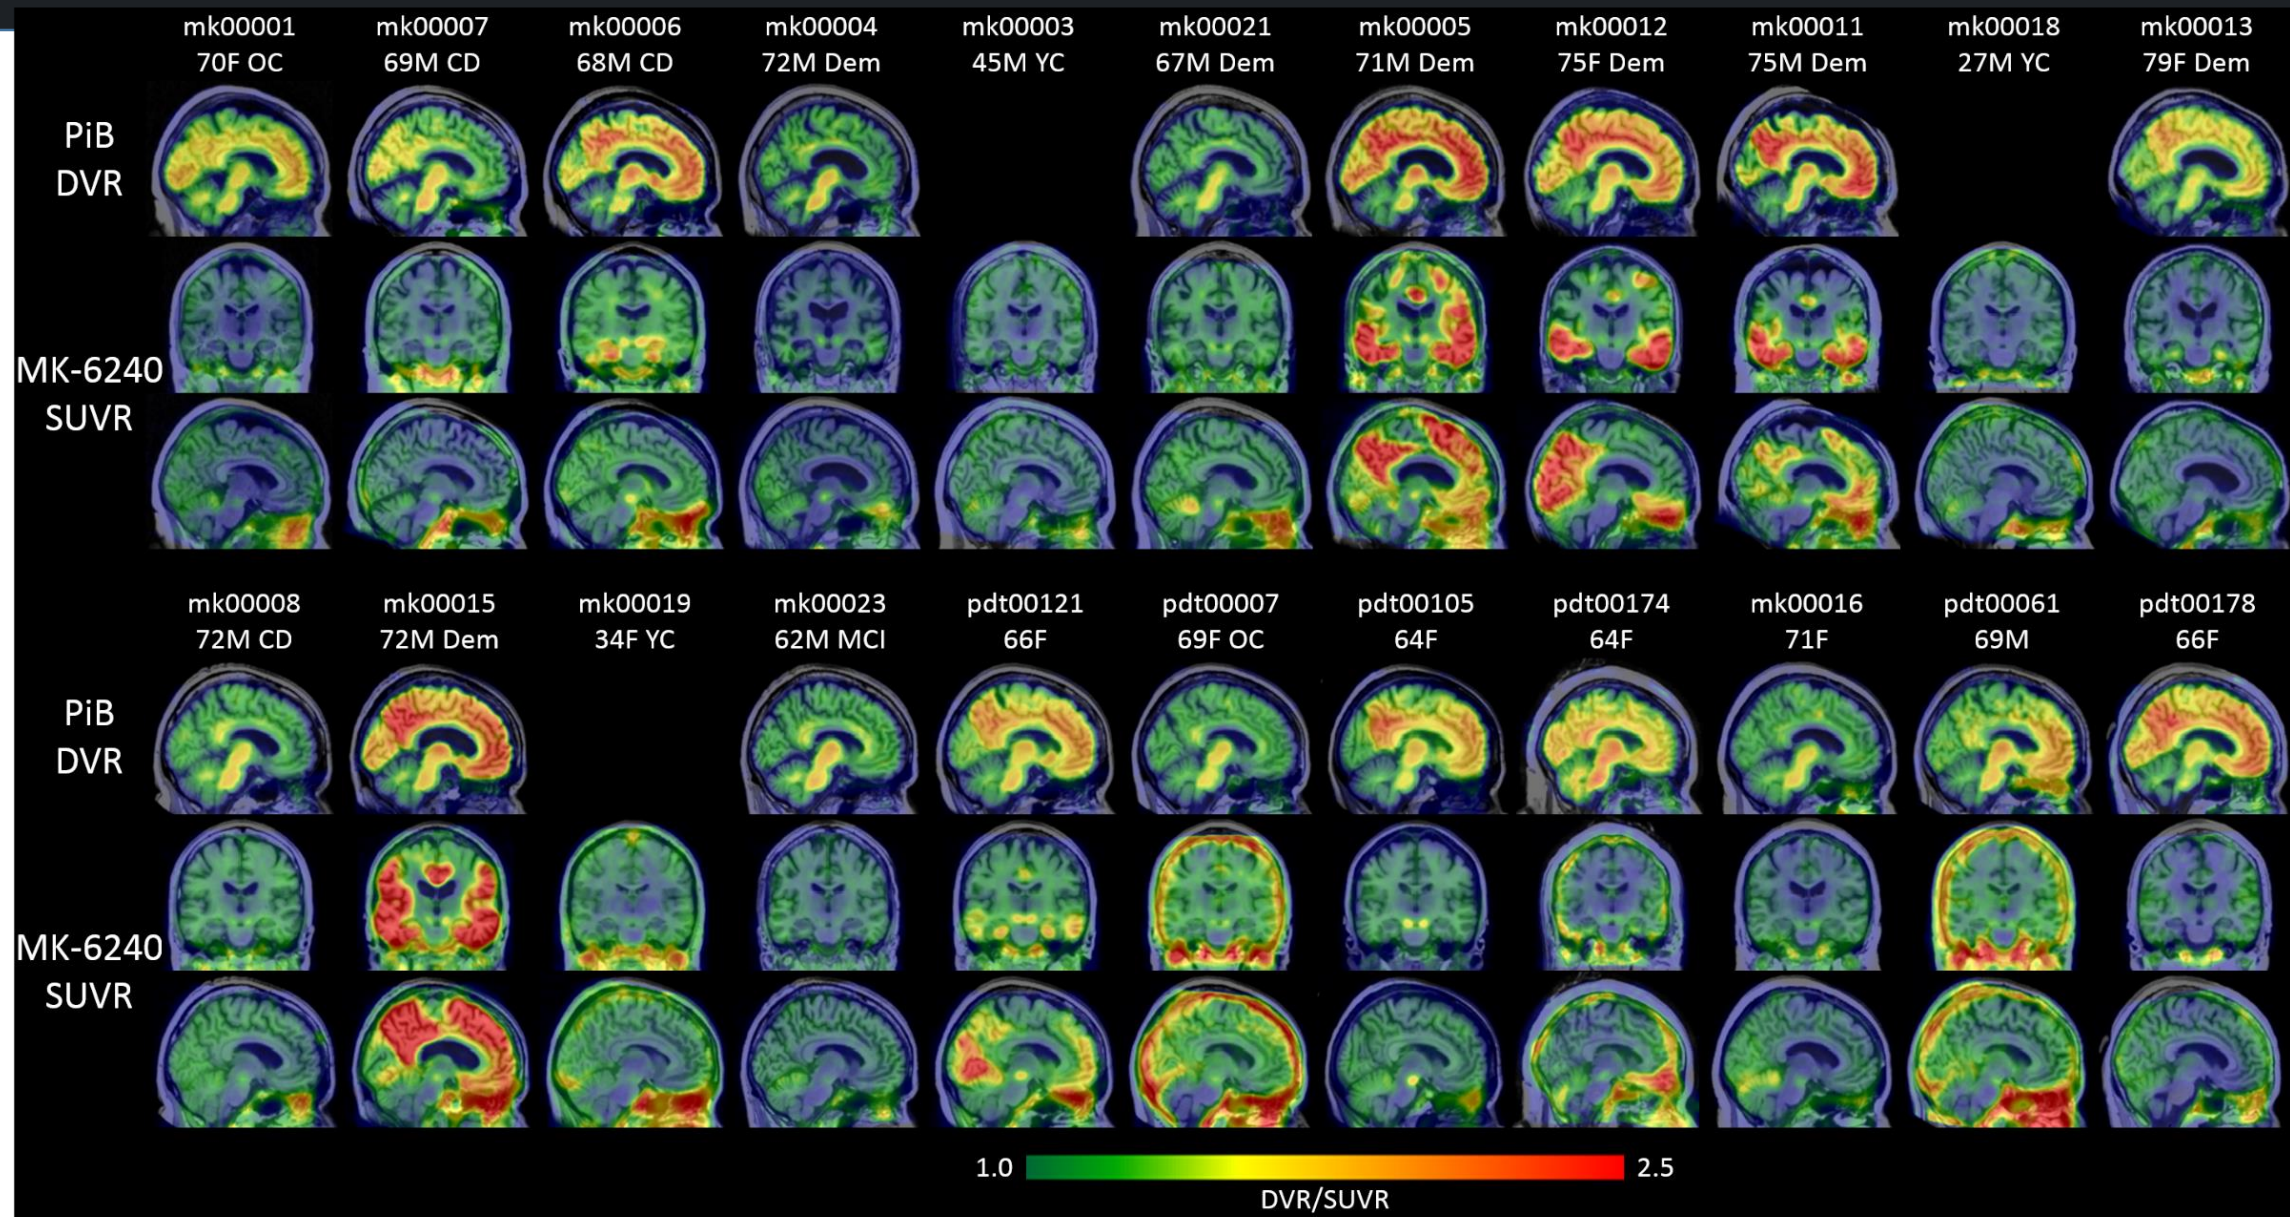

Wisconsin ADRC: Healthy Behaviors and CSF and Imaging Markers of AD

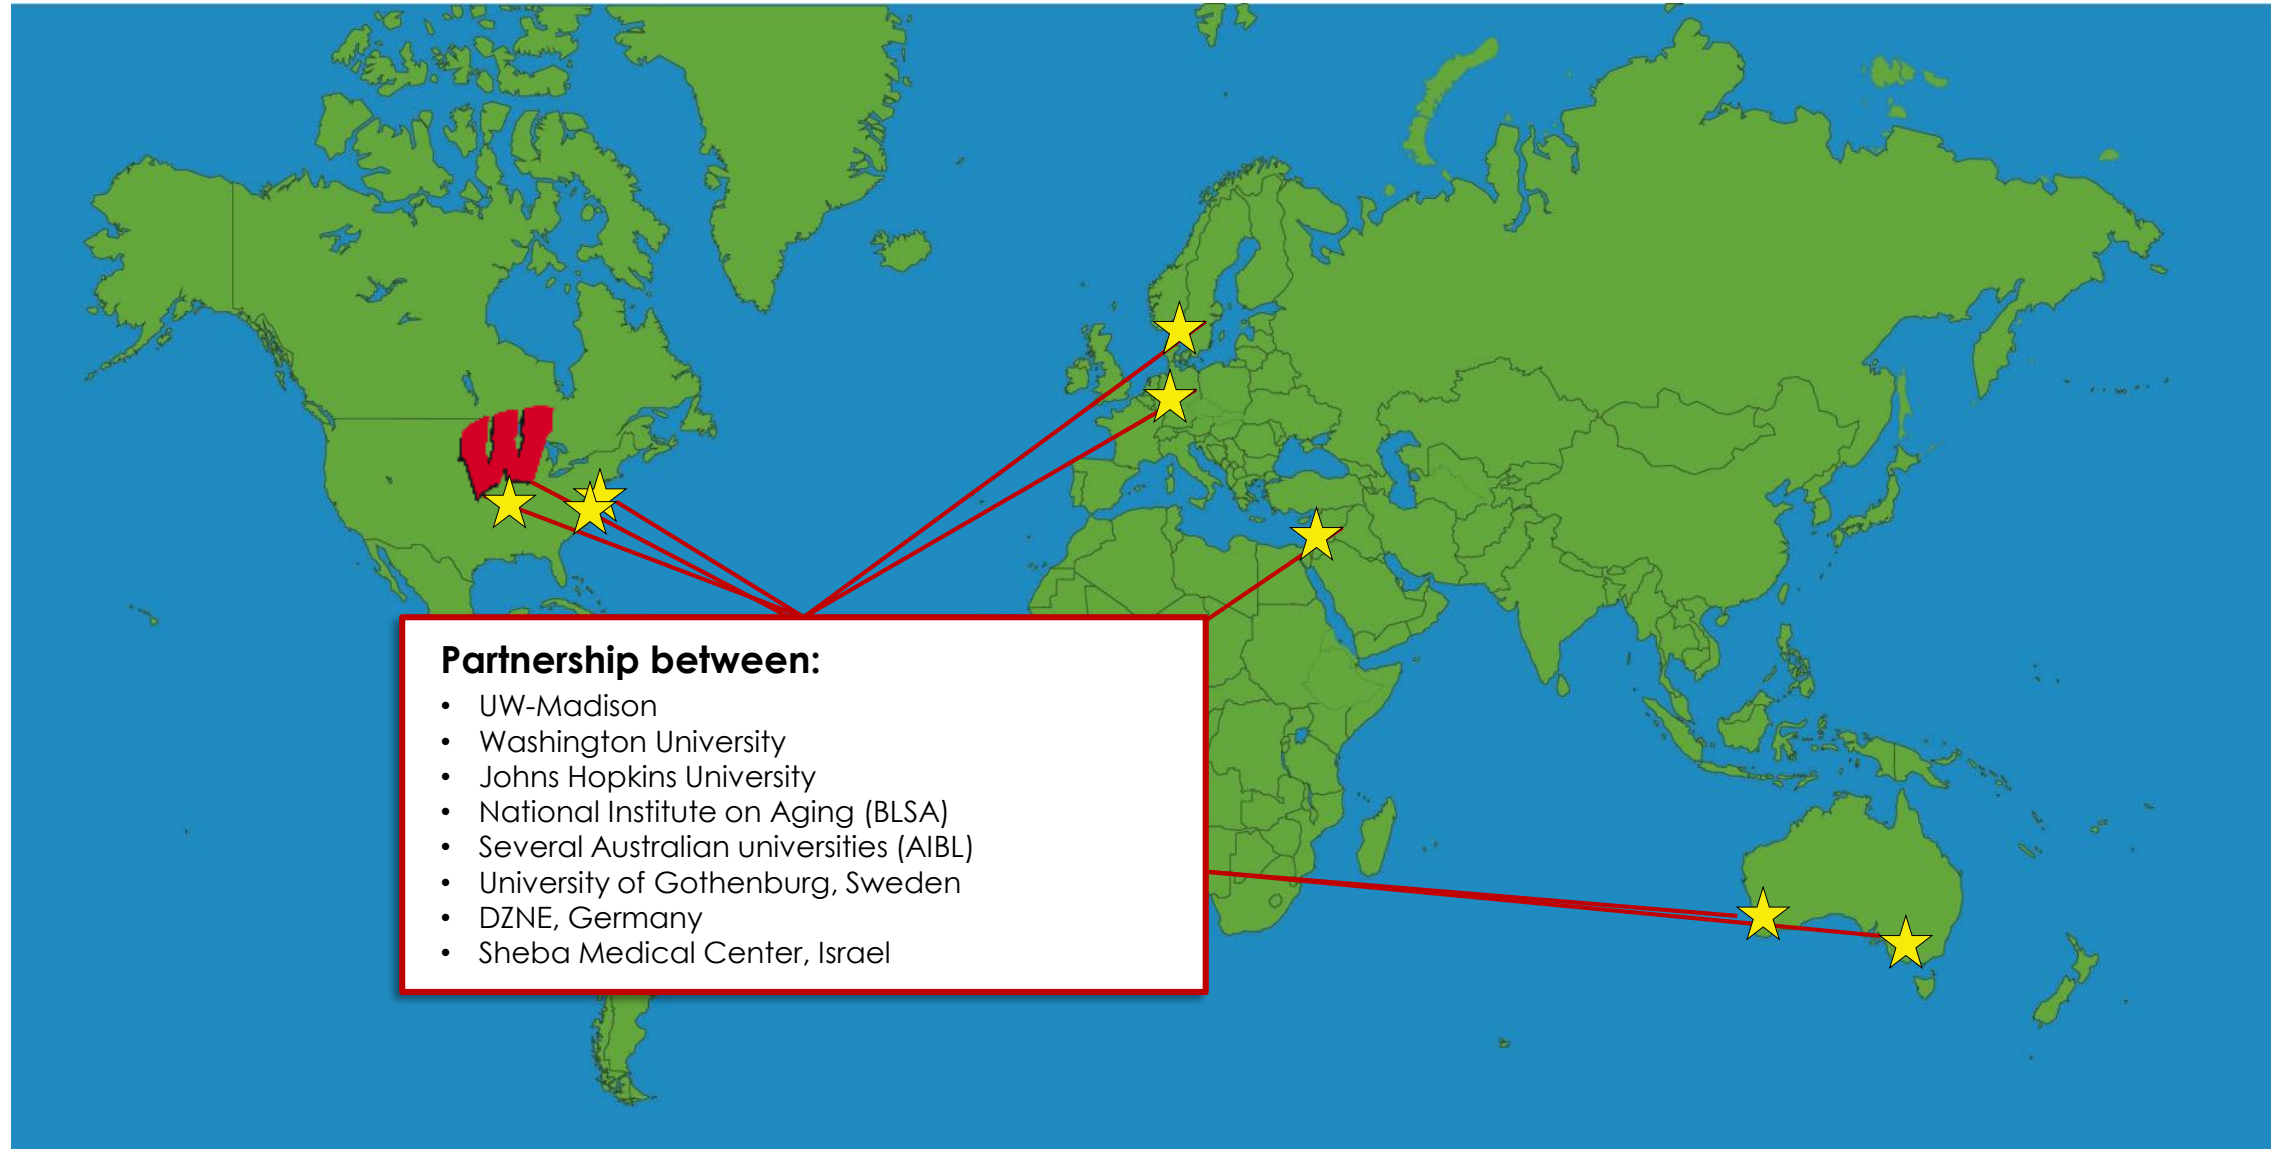

Health Behaviors and AD pathology / risk

Wisconsin ADRC: PIB amyloid and [F-18]MK6240 tau PET Ligands Across the AD Spectrum

Wisconsin Global Partnerships and Preclinical AD Consortium

Conclusions

- The field of CSF Biomarkers of AD is rapidly expanding with the potential discovery of new mechanism-driven biomarkers
- An important caveat in interpretation of CSF biomarker data is variability in sample processing, storage, shipment and analytical techniques between studies and sites
- Better understanding of who is amyloid and tau positive and if they develop clinical symptoms will be key to understanding cognitive reserve and resilience to AD
- Beneficial effects of healthy behaviors on resilience and risk for AD could be assessed through CSF biomarkers
- CSF biomarkers of cognitive reserve have a high potential to predict and represent resilience to AD; they will become an important component of multimodal approaches to predict conversion from preclinical to clinical stages of AD
- The validity and clinical utility of newer CSF cognitive reserve and AD biomarkers has to be systematically evaluated
